

Fraud Prevention Ecosystem

Project Overview

Fraud Prevention Ecosystem is an enterprise-grade fraud detection and case management platform developed for Dell's Return on Product and Accessories process. The solution helps support agents identify duplicate replacement requests, manage aging cases, and maintain compliance with the 72-hour SLA requirement.

Business Problem

Customers could submit duplicate replacement requests using different combinations of addresses, contact numbers, email IDs, cities, regions, areas, and pincodes. These activities increased the risk of duplicate shipments, operational inefficiencies, and financial losses.

Solution Implemented

Designed and developed a scalable fraud prevention platform with interactive dashboards, AI/ML-based risk identification, duplicate detection mechanisms, SLA monitoring, and case prioritization capabilities.

Technologies & Skills Used

React.js, .NET / ASP.NET, SQL Server, REST APIs, Artificial Intelligence (AI), Machine Learning (ML), Data Modeling, ETL & Data Transformation, Fraud Analytics, Risk Scoring, SLA Monitoring, Case Management Analytics, Dashboard Development, KPI Design, Data Visualization, and Duplicate Detection Logic.
